

Save The Polar Bears:
Reduce Your Carbon Footprint

Polar bears live in the North Pole, where there is only ice. They are endangered. Not only that, but there are no trees that produce oxygen. They can suffocate if we produce too much carbon dioxide. They might even go extinct. But there are three simple ways to help reduce your carbon footprint and save the polar bears.

1. Walk.

We have legs. But, many people use them to drive cars and other vehicles. All types of vehicles emit carbon dioxide, even if the amount is different. Your legs, on the other hand, only emit heat and sweat. As a general rule of thumb, only drive when needed.

2. Recycle.

When you throw something away, it goes to the landfill. Then it goes to an incinerator. Trash falls down and burns up emitting a boatload of carbon dioxide. It's better to recycle. That way, trash doesn't go down the incinerator.

3. Save Energy.

If it's just leaving a light on or opening up the garage door, you are using energy. The electric plant makes energy for us. But it burns things and releases carbon dioxide into the air. Saving energy reduces the amount burnt at the plant. The plant may never stop, but if everybody starts saving energy, that giant cloud of carbon dioxide will become a wisp of smoke. So start saving energy by turning off unneeded appliances.

Those were three ways to stop global warming, reduce your carbon footprint, and of course, save the polar bears. But there's more to that. There are endless ways to help the Earth and the bears. We can all save the Earth and the polar bears if we all reduce our carbon footprints.
